MESHALKINA, N.I.

Some biochemical indicators in rheumatism. N. I. Meshalkina, V. P. Popova, and V. N. Zakha: *Voprosy Revmatizma v Gor'koye Oblasti* (Kulgoizdatel. Gor'ki) 1954: 8-9; *Referat. Zhur. Khim., Biol. Khim.* 1955, No.

4091. --Protein, sugar, K, and Ca in the blood of 77 patients with rheumatic carditis in various stages and with circulatory deficiency were found to be within normal limits. As the conditions progressed these blood constituents dropped to the lower normal level. Sugar curves following double administration of glucose differed from the normal during the active period of the disease, especially in patients having marked circulatory insufficiency. B. S. Levine

*Handwritten notes at top left of page.*

✓ The process of hardening and the technical properties of (sodium silicate)-magnesia refractories for lining rotary kilns. Ya. V. Klyucharov and N. V. Meshalkina. *Tsement* 23, No. 5, 14-19(1957). The nature of the setting process of mixts. of MgO and water glass, long used in the manuf. of refractory linings, and their prepn. and properties were subjects covered in a series of studies involving use of methods of microscopic, x-ray, spectroscopic, thermal, and gravimetric analysis. Silicate solns. used were of const. sp. gr. 1.35, but the SiO<sub>2</sub>:Na<sub>2</sub>O ratio ranged through 2.0, 2.7, to 3.5. Temps. of MgO calcination were 600°, 900°, 1200°, and 1600°. Rates of drying and setting were measured under conditions of air at 80°, in moist air at room temp., and in storage under water, through periods varying from 1 day to 9 months. Setting is rapid in air at 80°, with attainment of a strength of 350 kg./sq. cm. in less than 1 day, while in moist air at room temp. that value was reached only in 10 days. Under water the 10-day strength was 50 kg./sq. cm. In general, the raising of the temp. of the surroundings during the setting period shortened the time and increased the strength of the specimen. Increase in the value of the SiO<sub>2</sub>:Na<sub>2</sub>O ratio shortened the time of setting although it raised the silicate demand of the mix. Reduction of particle size likewise reduced setting time through increase of total surface. Spectroscopic, x-ray, and petrographic analyses indicated the formation of a type of cerolite, MgO.SiO<sub>2</sub>.H<sub>2</sub>O. The reactions of the formation of the hydrosilicates take place during storage *in air* (mugs completely in water) with the formation of an infrared absorption band corresponding to the group Si-O-Mg. On long standing in water or in the autoclave MgO disappeared completely.

TITLES: Conference of Young Specialists (Konferentsiya molodykh spetsialistov)

PHILOGICAL: Ogneupory, 1959, Nr 1, pp 47-47 (USSR)  
ABSTRACT: This conference of young specialists of the Technological Institute of Refractories (All Union Institute of Refractories) was held in Leningrad on November 19-24, 1959, with the participation of representatives of Ukrainian Institute and the Ukrainian Institute of Refractories (Ukrainian Institute of Refractories). The conference was presided over by the head of young engineers and technicians of the Technological Institute of Refractories, outlined his opening speech, the work of young specialists of various special branches, designating it as successful. Further, following reports are mentioned: V. G. Fegler spoke about manufacturing methods of superstable panicles made of boron siliceous rocks (barovitrana "krasnava"); B. V. Meshalkina reported on test results of the properties of magnesium silicates on liquid glass; I. V. Vishnevskiy (USSR) reported on the dynamic method of determination of the modulus of elasticity at temperature up to 1300-1400; spoke about the examination of the changes of these composition of worn-out refractory aggregate-stream products; E. V. Zhuravina reported on elaboration results of spectroscopic method for the alumina content in types of clay; G. A. Steinhilber stated the causes of the fracture of the refractory material by means of telescopic transmission; G. A. Eba used a telescopic transmitter for the automatic control of mold charging on the Pilsa 6M-14; V. M. Lebedev reported on the working out of the design for a new furnace cart; V. Z. Shren reported on the design of water supply and distribution; A. M. Levin reported on the questions of air des. salination; E. Z. Berejzson dealt with questions of air des. salination; E. M. Berejzson reported on the foundation of a furnace; A. Z. Varfel reported on the beginning of operation and installation of a rotary furnace at the Borzhomskiy chemical plant; As a principal default it was stated that part of the young specialists still insufficiently familiar with the production, the measures provided for by the Party and Government to reform the universities and to strengthen their relations, merit in operation when improve the training of specialists.

TITLE: The Dependence of the Technical Properties of a Magnesite Fire-Resisting Mixture on Certain Technological Factors

PERIODICAL: Tsement, 1959, Nr 5, pp 13 - 20 (USSR)

ABSTRACT: The author states that at present the burning zone of rotary kilns is lined with chrome-magnesia bricks, laid upon flat or corrugated iron pieces or on a magnesia mixture. The life of the lining of the latter system is 20 to 30 percent longer than that of the first. For an improvement in the quality of the above mixture the dependence of its properties upon the composition must be known. The properties will depend on the burning of the magnesite, the mineralogical composition, grade of pulverization, storage duration of the pulverized filler, modulus and concentration of the water glass, and upon the conditions and period of storage of the mixture. The effect of a preliminary burning of the magnesite was verified for mixed masses of the material with magnesite used as a filler. It burned especially at temperatures of

The Dependence of the Technical Properties of a Magnesite Fire-Resisting Mixture on Certain Technological Factors

800, 1200 and 1600°, (M - 800°, M - 1200°, M - 1600°). The content of magnesium oxide used in the material varied from 98.97% (fused magnesite) to 81 - 83% (caustic magnesite of various batches). All materials were pulverized to grain 5 to 15% of over 60 $\mu$ , 65 to 75% of 60 to 10 $\mu$ , 25 to 35% of less than 10 $\mu$ , including 6 to 8% of grain below 1 $\mu$ . The author reviews all possible physico-chemical transformations of mixtures able to influence strength, thermal resistance, durability, storage conditions, and concludes that the ground magnesite MPK powder represents the best filler, and that the water glass with a modulus of 2.7 and a density of 1.25 is the best binder. There are 9 tables, 5 graphs and 2 Soviet references.

TITLE: Changes in the content of nucleic acids in the tissues of mice under the effect of gyurza (vipera lebetina L) venom and "antigyza" serum

SOURCE: Byulleten' eksperimental'noy biologii i meditsiny, v. 62, no. 8, 1966, 36-39

TOPIC TAGS: nucleic acid, blood, liver, blood serum, poison effect, antidote

ABSTRACT: A study has been made of changes in the content of nucleic acid in the blood, liver, and spleen of albino mice under the effect of gyurza venom, venom, and antivenom serum in combination, and under the effect of the antidote alone. It is concluded that the toxic effect of snake venom is connected not only with hemolysis, cytolysis, and other effects of venom, but also with its nuclease

activity. Nucleases, while destroying nucleic acid, prevent the development of defensive reactions of the body, in particular, the synthesis of antienzymes-antibodies. At the same time, the reduction of nuclease activity of venom under the effect of "antigyurza" serum makes it possible to bring into play these defensive reactions in inoculations involving such a strong antigen as snake poison. TITLE: The Effects of Non-specific Stimulation of the Skin Integuments on the Body's Immunological Reactions

PERIODICAL: Zhurnal mikrobiologii, epidemiologii i immunobiologii, 1959, Nr 9, pp 104-111 (USSR)

ABSTRACT: With certain infectious diseases the skin reactions are indices of the body's immune response: P.A. Alisov, N.F. Gamaleya, N.V. Galanova, A.T. Kravchenko, Ye.Ya. Gindes, G.I. Beloglazov, A.M. Polyakova, N.A. Yakhnina, L.K. Korovitskiy, Zabezhinskiy, P.A. Vershilova, V.M. Berman, D.K. Bessonov, V.M. Gerkes, S.M. Aluker, Nikol'skiy and A.V. Shevchenko. Other researchers have demonstrated that the most effective method of immunization is often the intradermal or cutaneous administration of specific antigen (G.F. Lang, D.D. Pletnev, A.M. Bezredka, Zabolotnyy, Korobkova and V.Ya. El'bert). To determine the part which the skin integuments play in immunogenesis, subject author studied the action on them of specific and non-specific stimuli alike, including bile, hot water bottles, electric current and mustard plasters. The tests were performed on rabbits and white mice. Non-specific stimulation of the skin of normal animals and animals immunized with Shigella dysen-

Card 1/3

SOV/16-59-9-23/47

The Effects of Non-specific Stimulation of the Skin Integuments on the Body's Immunological Reactions

teriae, Salmonella typhosa and Staphylococci led to a change in the general and immune response of the body. Non-specific stimulation of immunized animals at a period when their immunological reactions were on the decline, in fact boosted the immune response. This was shown not only by a rise in the agglutinin titer and the phagocytic activity of the leukocytes but also by intensification of the serum's protective power. Overstimulation, i.e. when the stimuli exceeded the body's general physiological threshold values, had an inhibiting effect on the protective response. Novocain block and induced narcosis invalidated the effects of stimulation. The author views the change in immune response under the effects of non-specific stimulation as a change in the general reactivity of the body, governed by the nervous system. The skin's receptor mechanism appear to play an essential part in perceiving stimuli from the external environment which can lead to a change in the general and immune response of the body. There are 7 tables and 25 references, 23 of which are Soviet, 1 French and 1 Scandinavian.

ABSTRACT:

Heated typhoid vaccine was given orally and subcutaneously to mice in one and two steps. In single subcutaneous immunization the mean immunizing dose ranged between 0.1—0.88 billion cells and in oral administration the mean immunizing dose was 400—500 times the subcutaneous dose. Two immunizations were not more effective than one. Orig. art. has: 2 tables.

SOURCE: Zh mikrobiol, epidemiol i immunobiol, no. 6, 1966, 147

TOPIC TAGS: microbiology, bacterial disease, disease control, clinical medicine, bacteria, epidemiology, scrub typhus vaccine, VACCINE, IMMUNOLOGY

ABSTRACT:

Reasons for the noneffectiveness of enteral scrub typhus vaccine have recently been discovered. When the vaccine reaches the digestive tract, digestive enzymes cause it to lose some its immunological properties. Experiments conducted by the authors showed that the antibody titer after seven days in rabbits immunized with heated vaccine was five times higher than in rabbits receiving two injections of vaccines preheated with stomach fluids. To protect the vaccine from digestive juices, it was enclosed in gelatine capsules coated with hydrolyzed fat plus stearine treated with formalin.
